PHYSIOLOGY LECTURE 2

CONTROL SYSTEMS OF THE BODY

Dr. Waleed R. Ezzat

Lecture Objectives:

- Define and describe the components of homeostatic control system.
- List the factors that are homeostatically regulated.
- Compare and contrast negative and positive feedback and explain the importance of these processes to homeostasis.
- Understand the gain of the control system and its physiological significance.
- Explain the feed forward concept and its importance for initiation of responses in anticipation of a change in internal environment.

Factors homeostatically regulated:

Factors of the internal environment that must be homeostatically maintained are:

1. Concentration of nutrient molecules.
2. Concentration of oxygen and carbon dioxide.
3. Concentration of waste products.
4. pH (hydrogen ion concentration).
5. Water volume and osmolality (essential electrolyte concentrations).
6. Plasma volume and pressure.
7. Core body temperature.

العوامل التي يجب الحفاظ عليها بنسب ثابتة

العوامل الأخرى ممكن بشرط تكون ثابتة بل تتوازن

العوامل التي تحافظ على هذه العوامل 7

الداخلية والبيئة الخارجية (حرارة الدم)

- حتى كل العوامل في جسم الإنسان يجب الحفاظ عليها ثابتة، فقط يوجد 7 عوامل للحفاظ عليها ويتم تسخير جميع العوامل الأخرى في سبيل أن تبقى هذه الـ 7 بنسب ثابتة. (بإمكاننا اعتبارها أهداف) (باقي العوامل تكون وسائل).

① Nutrients

② O_2 / CO_2

③ waste

④ PH ⇝ H^+

⑤ water

⑥ Plasma and pressure

⑦ core temperature

Control systems of the body

- Control systems of the body are in thousands. Starting from the cellular level and ending in throughout the entire body control systems.
- To maintain homeostasis, the control system must be able to:
  1) Detect deviations from normal in the internal environmental factor that needs to be held within narrow limits.
  2) Integrate this information with any other relevant information.
  3) Make appropriate adjustments in the activity of the body parts responsible for restoring this factor to its desired value
- Examples are Na^+-K^+ pump, genetic control, pH regulation, and thermal regulation of the body.
- Homeostatic regulation of a single physiologic factor often involves several cooperating control systems (mechanisms) activated at the same time or in succession.

- عند أنظمة التحكم بالجسم بالآلاف سواء على مستوى الخلية أو على مستوى جهازين مثل نظام التحكم بتراكيز K^+ / Na^+ بغشاء الخلية ، أو نظام الـ pH ، أو نظام الحرارة .

- لازم بنظام التحكم يتوفر ٣ شروط هذه حتى يعمل :-

① (Detect) لازم يكون عنده قدرة على اكتشاف الخطأ

② (Integrate) يربط المعلومات بمعلومات أخرى ويرتبها

③ (adjusments) يكون عنده القدرة على التغيير والتصحيح

معلومة :- البول بالحالة الطبيعية يكون حمضي لأن الكلى تتخلص من أيونات H^+ الزائد مع البول ، وهذا واحد من أدوار التحكم الكلوي بحافظ على الـ pH

يكون يتحد أكثر من control system حتى يصنع واحد من ال

Control systems of the body (Cont.)

- The more important a variable, the more numerous and complicated are the mechanisms that operate to maintain the steady-state at the desired value.
- The efficiency of the homeostatic mechanisms varies over a person's lifetime, with some homeostatic mechanisms not being fully developed at birth and others declining with age.
- For example, a newborn infant cannot concentrate urine as an adult. Older adults are less able to tolerate stresses, such as exercise or changing weather, than are younger adults.
- The control systems are characterized by their:
  1. *Negative feedback nature (the majority)*
  2. *Positive feedback nature*

• الجسم homeostatic تتغير أثناء مراحل حياة البني آدم ، للأحسن أو للأسوأ ، على سبيل

المثال الطفل الوليد كليته لا تستطيع أن تركز البول بشكل جيد ، لكن مع مرور الوقت يصبح قادرا

الكبار بيتحولوا الجفاف أكثر من الصغار.

• يعمل ال control system بطريقتين :-

① Negative feed back ← أغلب التغيرات بواحد من ال

الجسم بيعمل على رد فعل معاكسة لهذا التغير

② Positive Feedback ← في حالة تغيير بيصير

رد فعل متماشية مع الاتجاه

* بال Physiology كلمة stress للاتجاه توتر عصبي

بل هي كلمة تصف كل شيء

غير طبيعي مثل نقصان الدم

والبرد الشديد والكسور

الشديدة ما الخ ...

Negative feedback:

- When some factors becomes excessive or deficient, series of changes occur that move the factor in the opposite direction of its initial change. That is, a corrective adjustment opposes the original deviation from the homeostatic steady-state.
- The components of a simple negative-feedback control system include:
  1. Regulated variable
  2. The receptor (sensor or detector)
  3. The control center (comparator or integrator)
  4. The effector (acts to oppose change)
- Example: Exercise → ↑ body temperature → stimulation of temperature-monitoring nerve cells in the hypothalamus → activation of cooling mechanisms (sweating) → ↓ body temperature.

* Negative :-

حتى نحكي عن سلبي لازم يتوفر فيه 4 مكونات :-

① Z لازم يكون الحساس (في كما هنا أسما)

② يكون في مستقبل (شيء يحس بالتغير) ← يرسل معلومات وبشكل مستمر للـ control center

③ control center

④ وجود عضو التنفيذ (Effector) ← يعاكس التغيير

يلي فيه الـ SetPoint وإذا الإشارة زادت أو قلت عنها بيعمل استجابة

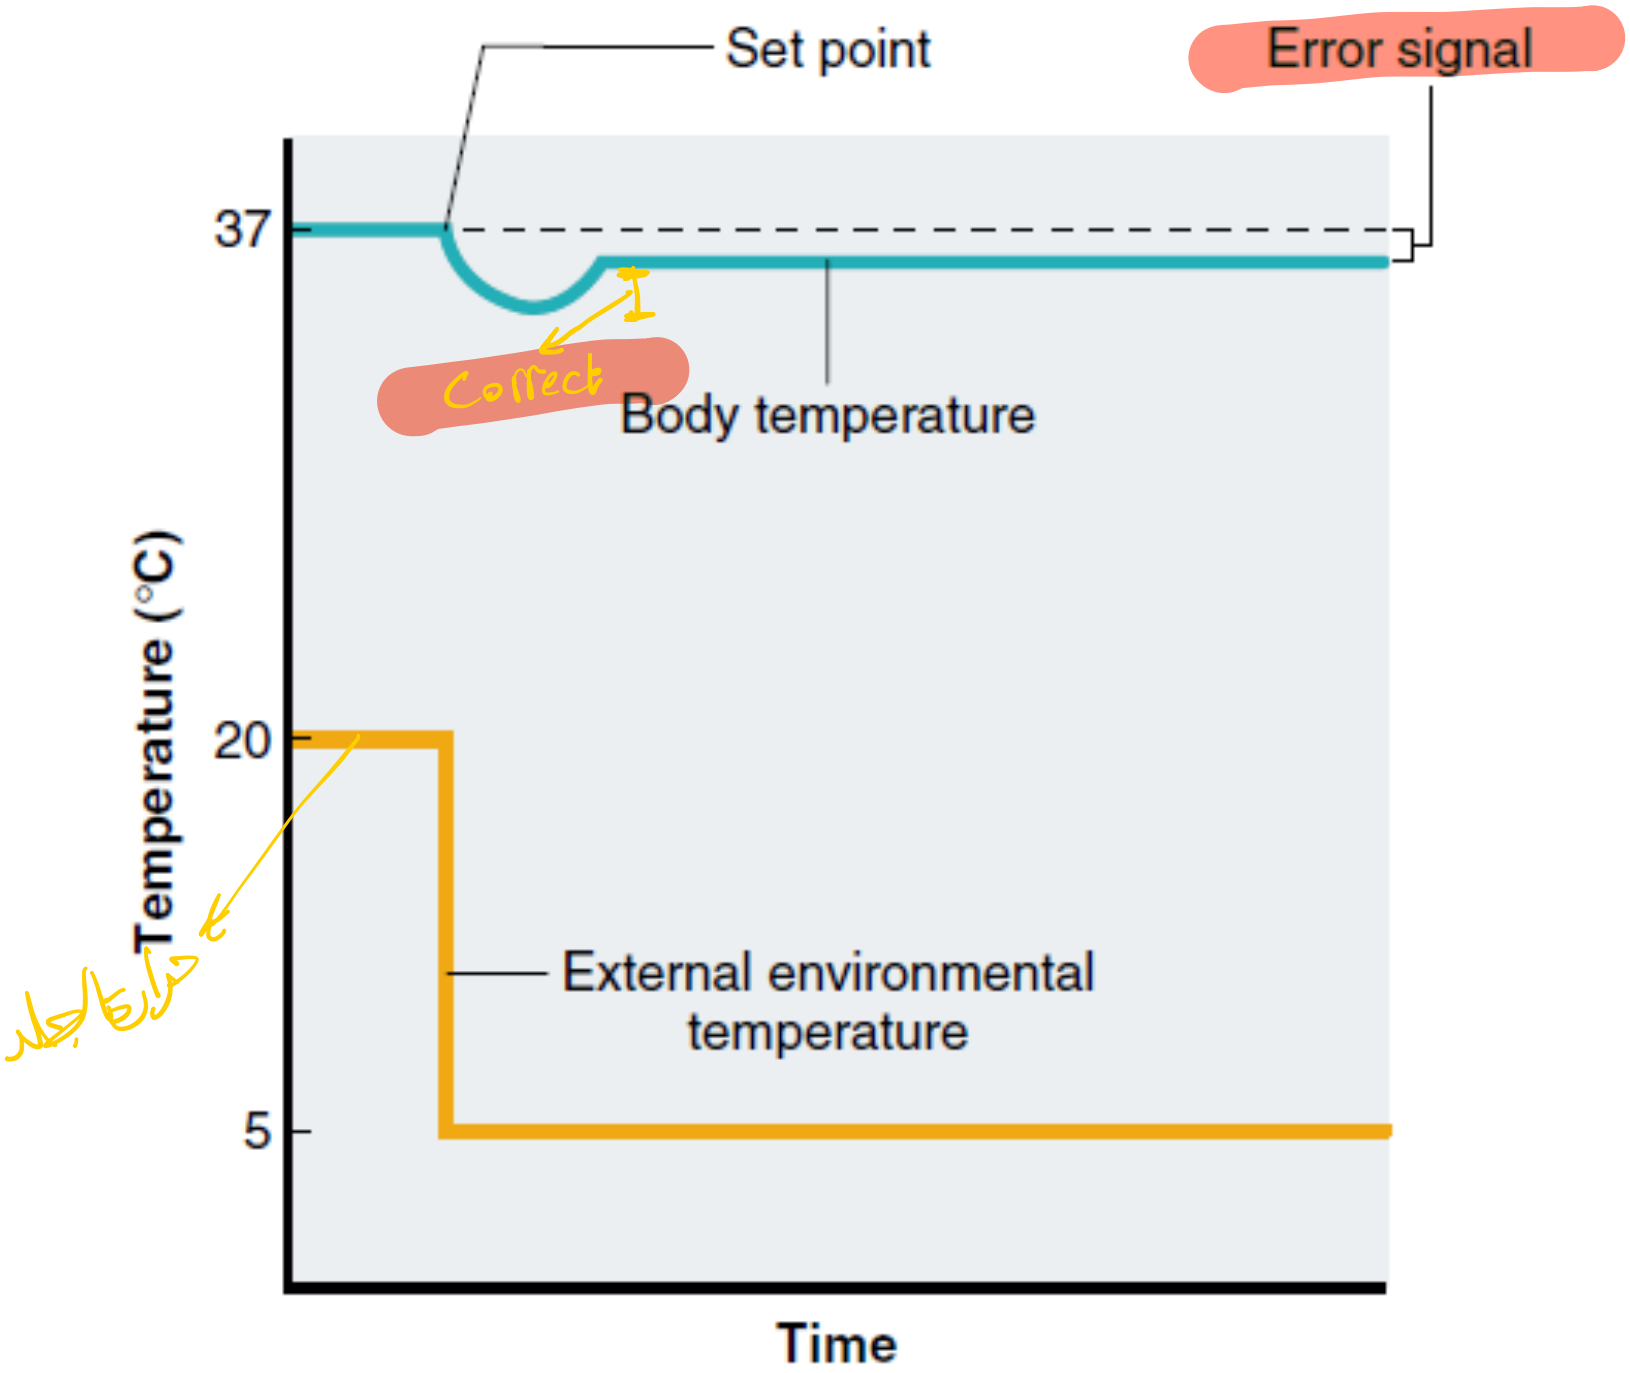
* المرضال هو النظام الحراري المذكور فوق

Gain of a Control System:

- The gain is degree of effectiveness with which a control system maintains constant conditions.
- The gain of the control system is calculated by the following formula:

$$The\ \mathbf{Gain}\ of\ a\ control\ system = \frac{Correction}{Error}$$

- Where the *Error* is the remaining uncorrected change from normality. The gain of baroreceptors is about -2, whereas the gain of temperature control system is about -33.



Set point
Error signal
37
Correct
Body temperature
Temperature (°C)
20
External environmental temperature
5
Time

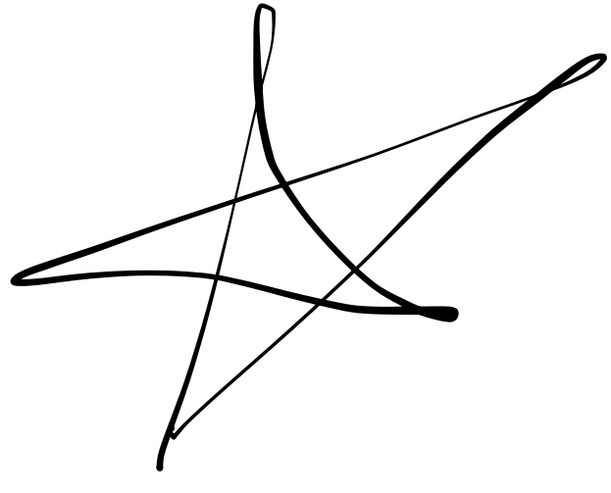
• ال Gain هو شلون نعرف ان ControlSystem إنا كان قوي أو ضعيف وبناءً عليه بنحدد .

$$Gain = \frac{Correction}{Error}$$

→ الصحيح

→ يالي طالصح

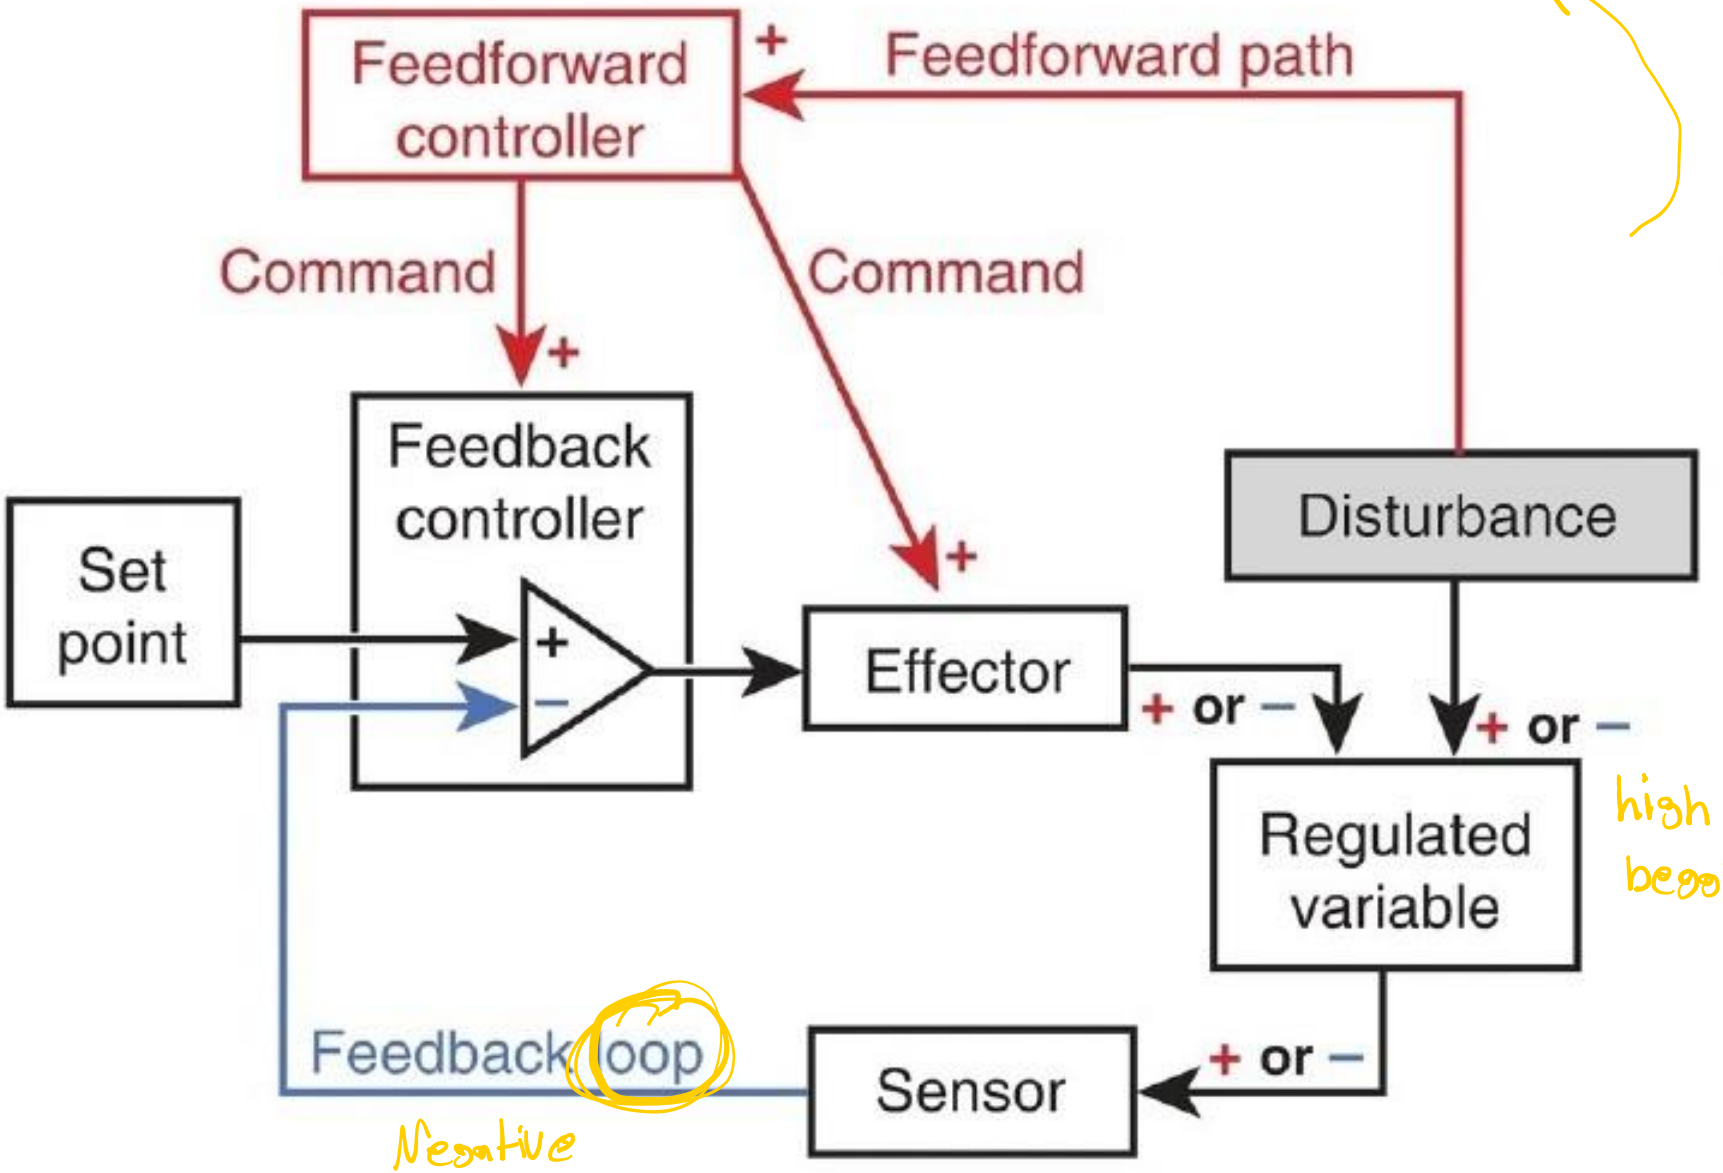
الي يكون طالعًا بالسالب ⊖



Feedforward Regulation:

اجراءات احترازية حتى لا يحدث السيء ما يصير

- Is another type of regulatory process usually acts in combination with negative-feedback systems
- The feedforward regulation **anticipates** changes in a regulated variable, improves the speed of the body's homeostatic responses, and minimizes fluctuations in the level of the variable being regulated - that is, it reduces the amount of deviation from the set point
- The operation of the controller is "**open loop**"; that is, the regulated variable itself is not sensed
- ***Example***; When outside temperature falls, skin nerve cells immediately detect the change and relay this information to the brain, which then sends out signals to the blood vessels and muscles, resulting in heat conservation and increased heat production even before the internal body temperature falls



Feedforward controller

- الجسم بصير يشتغل قبل ما يصير ال change السلبي.

← يسمى ال anticipation

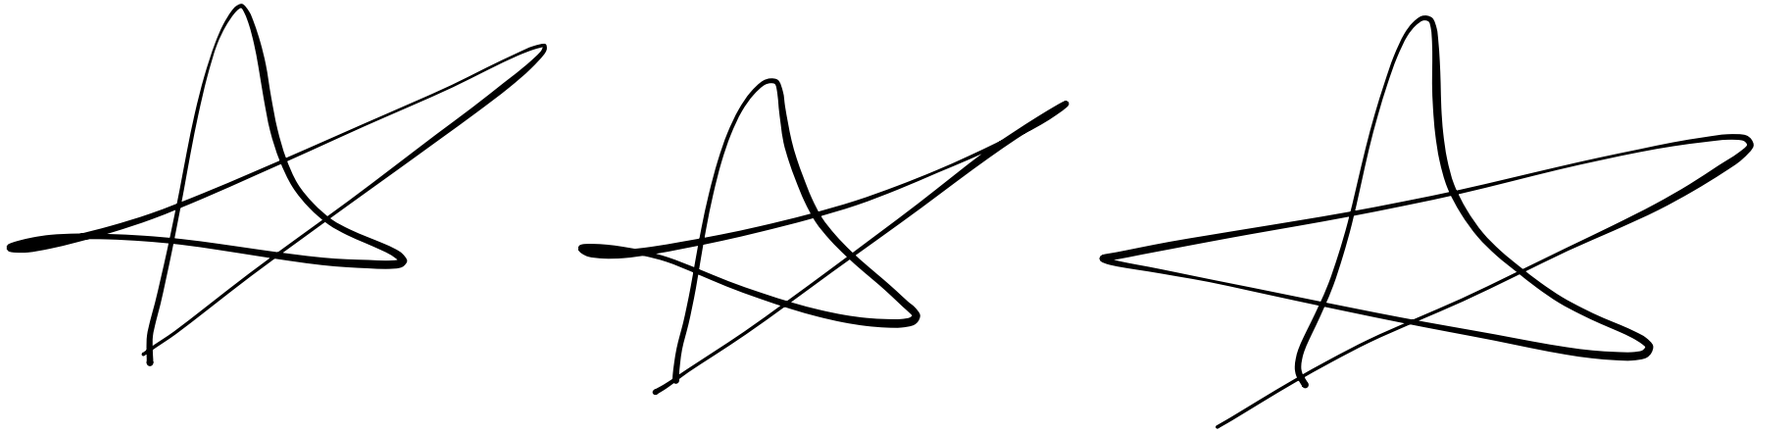
← مثلاً ما يصير الجلد شاحب بالبرد عشان يقلل الدم يلي بالجلد حتى ما نفقد حرارة الدم.

← ومثال آخر حصة الأنسولين والدم.

* ال feedforward ليس loop بل هو إجراء

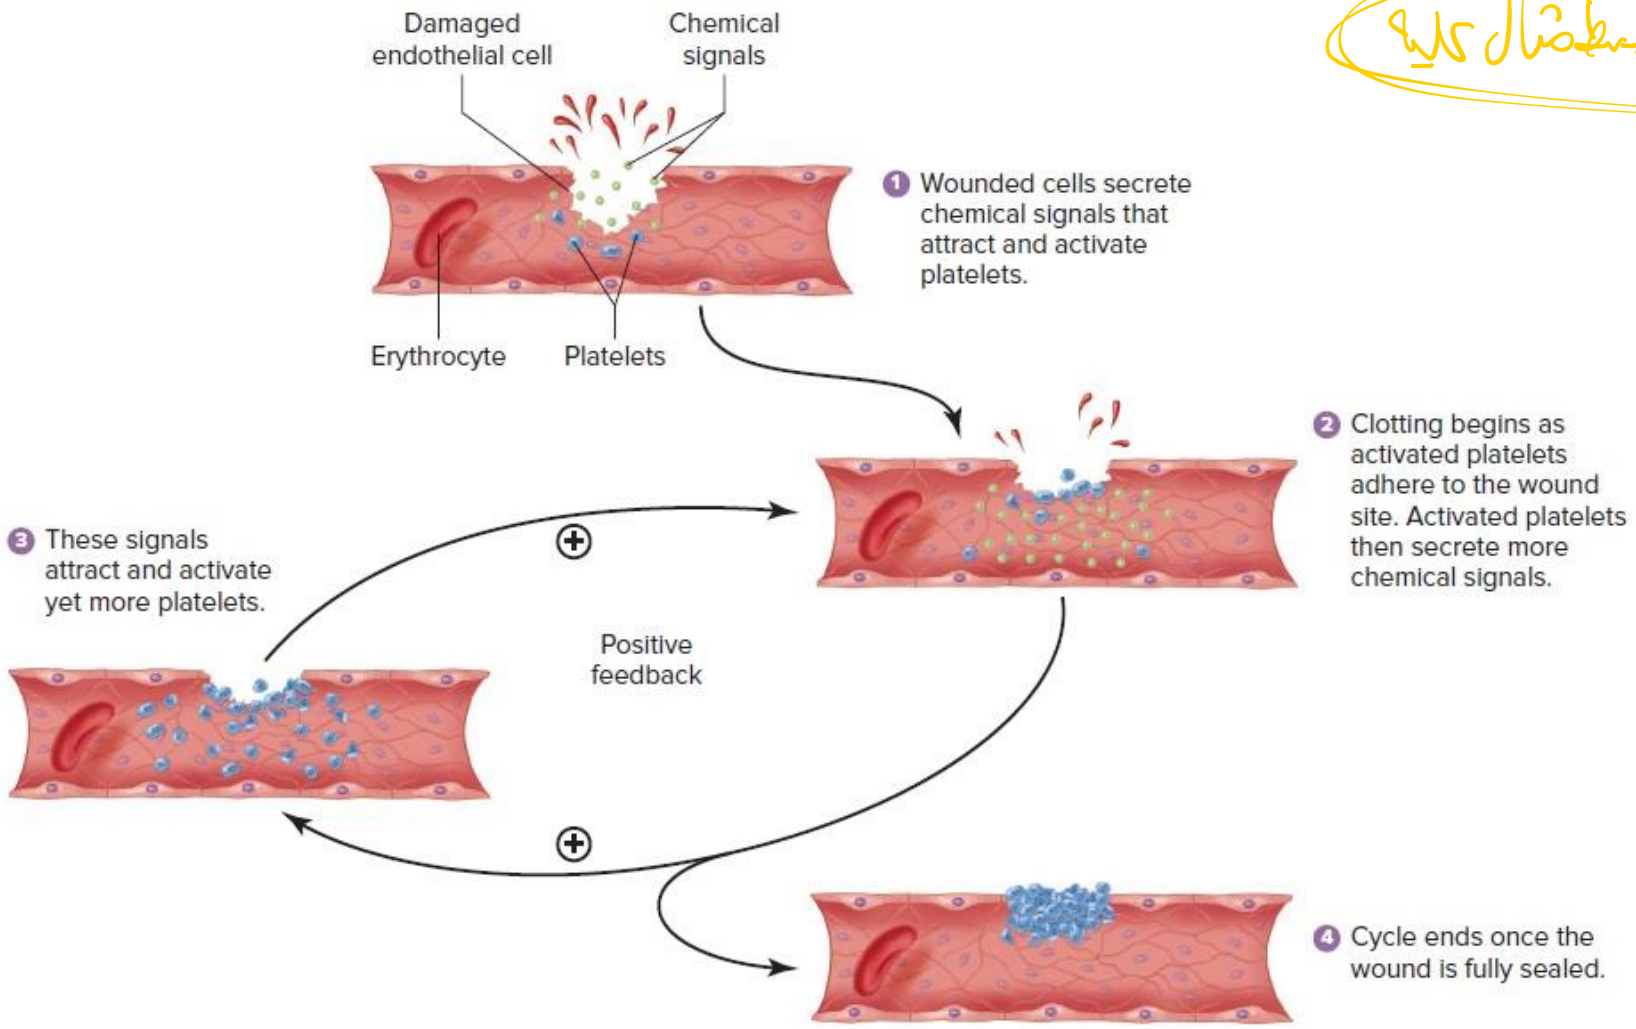
أو مجموعة إجراءات ذي خط واحد / ال Negative feedback

هي التي تكون loop .



Positive feedback:

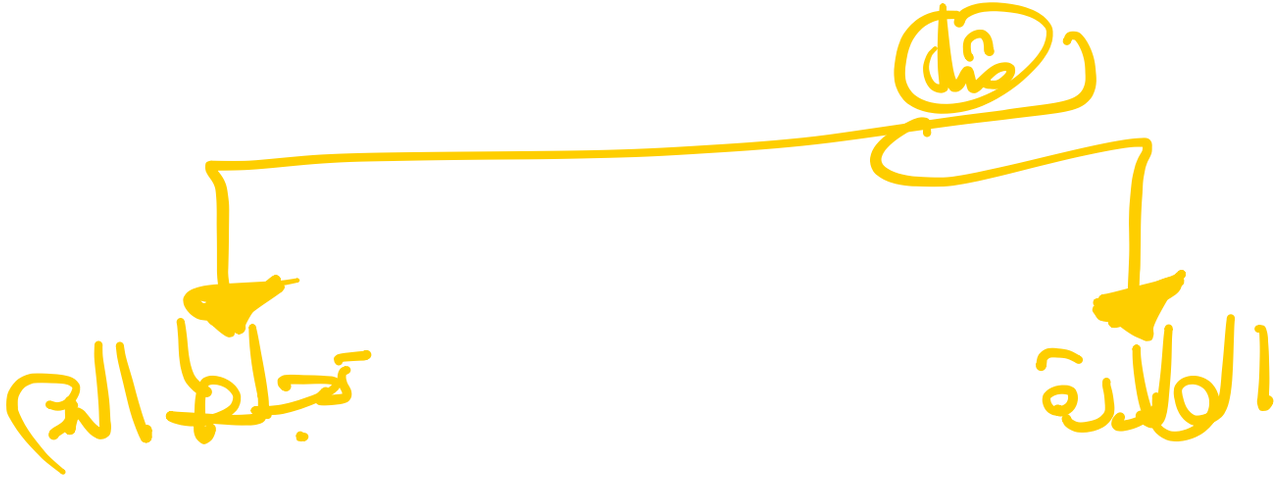
- The change induces further change leading to an amplified effect that ends in **vicious cycle**. It can be useful in some cases; e.g. blood clotting, childbirth (initiation of uterine contraction), generation of action potential in membrane of nerve cell when Na^+ ion influx begins, ovarian ovulation, etc.
- The positive feedback may be considered as a part of an overall negative feedback process.
- **Example:** blood clotting, the positive feedback clotting process is a negative feedback process for the maintenance of normal blood volume.



Positive feedback as illustrated by the clotting process in blood. Damaged endothelial cells in the lining of a blood vessel secrete chemical signals that attract and activate platelets. As clotting begins, the activated platelets produce chemical signals of their own, attracting and activating **more** platelets to the wound site, which then produce yet **more** chemical signals, and so on. The cycle ends when the wound is fully sealed.

*Positive :-

لما يصير التغير بدل ما أي كمية أزيده.



• يمكن اعتبار ال Positive جزء من كامل ال Negative

#

Test Question:

Q. Which statement about feedback control systems is incorrect?

A. Most control systems of the body act by negative feedback.
B. Positive feedback usually promotes stability in a system.
C. Generation of nerve actions potentials involves positive feedback.
D. Feed-forward control is important in regulating muscle activity.
E. A feedback gain of -3.0 can correct 3/4 of the initial error.
