## Pathology Lecture 2

### Central Nervous System Tumors

#### 2) Neuronal Tumors

1. Central neurocytoma:	2. Gangliogliomas	3. Dysembryoplastic neuroepithelial tumor
GENERAL FEATURES	GENERAL FEATURES	GENERAL FEATURES
<p>-Low-grade</p> <p>-Within and adjacent to the <b>ventricular system</b> (Lateral or third ventricle)</p> <p>-Composed of evenly spaced, round, uniform nuclei and often <b>islands of neuropil</b></p>	<p>- Mixture of <b>glial elements</b>, usually a <b>low-grade astrocytoma</b> and <b>mature appearing neurons</b></p> <p>- Most are <b>slow-growing</b> and present with seizures.</p>	<p>- A low-grade tumor of <b>children and young adults</b> that grows slowly</p> <p>- In the <b>temporal lobe</b></p> <p>- Manifests as a seizure</p> <p>- <b>Floating neurons in a myxoid background</b></p>

#### 3) Embryonal (Primitive) Neoplasms

Medulloblastoma (WHO grade IV)				
ANATOMICAL SITE & AGE	GENERAL INFORMATION	PATHOGENESIS	GROSS	MICROSCOPIC
<p>- Occurs in more <b>children</b> and in the <b>cerebellum</b></p> <p>- <b>Children:</b> Midline of the cerebellum</p> <p>- <b>Adults:</b> Lateral of the cerebellum</p>	<p>- Primitive Neuroectodermal Tumor: <b>PNET</b></p> <p>- Primitive <b>small cell (blue cell) tumor</b> BLUE: DARK CELLS</p> <p>- Presents with Sx &amp;Sx of ICP (headache, nausea, vomiting)</p> <p>- Highly <b>malignant</b>, and the prognosis for untreated patients is dismal; however, it is <b>radiosensitive</b>.</p> <p>- <b>With treatment, the 5-year survival rate may be as high as 75%.</b></p>	<p>-<b>Oncogenic pathways</b> in these tumors are the following:</p> <ul style="list-style-type: none"> <li>• <b>Wnt pathway activation:</b> have the <b>most favorable prognosis</b></li> <li>• <b>Hedgehog pathway activation:</b> have an <b>intermediate prognosis</b>, but the <b>concomitant presence of TP53 mutation</b> confers a <b>very poor prognosis</b>.</li> <li>• <b>MYC overexpression due to MYC amplification:</b> have the <b>poorest prognosis</b></li> </ul>	<p>- Well circumscribed, friable and extend to involve the leptomeninges</p>	<p>- Densely cellular, with sheets of anaplastic ("<b>small blue</b>") cells</p> <p>- Tumor cells are small, with <b>little cytoplasm and hyperchromatic nuclei</b>; mitoses are abundant.</p> <p>- Often, <b>focal neuronal differentiation</b> is seen in the form of <b>Homer Wright Rosettes</b> (primitive tumor cells surrounding central neuropil "pink material formed by neuronal processes")</p>
<p><b>Medulloblastoma subtypes</b></p>	<p><b>1. WNT</b> MOLECULAR FEATURES: <b>CTNNB1</b>, Monosomy 6 5-YEAR SURVIVAL: <b>95%-100% GOOD PROGNOSIS</b> ANATOMICAL SITE: <b>Dorsal Brainstem</b></p>	<p><b>2. Shh</b> MOLECULAR FEATURES: GL1, PTCH1, SMO, SUFU, <b>TP53</b> 5-YEAR SURVIVAL: <b>40%</b> (P53 MUTANT), <b>80%</b> (P53 WILDTYPE) INTERMEDIATE PROGNOSIS ANATOMICAL SITE: <b>Cerebellar Hemisphere</b></p>	<p><b>3. Group 3</b> MOLECULAR FEATURES: FSTL5, <b>MYC</b>, VEGFA 5-YEAR SURVIVAL: <b>30-60% POOR PROGNOSIS</b> ANATOMICAL SITE: <b>Midline</b></p>	<p><b>4. Group 4</b> MOLECULAR FEATURES: KDM6A, <b>MYC</b>, OTX 5-YEAR SURVIVAL: <b>75%</b> ANATOMICAL SITE: <b>Midline</b></p>

## 4) Other Parenchymal Tumors

### 1. Primary Central Nervous System Lymphoma

GENERAL FEATURES	GROSS	MICROSCOPIC
<ul style="list-style-type: none"> <li>- Mostly as diffuse large B-cell lymphomas</li> <li>- It is the <b>most common</b> CNS neoplasm in immunosuppressed individuals (Nearly always positive for EBV)</li> <li>- It is an <b>aggressive</b> disease with a relatively <b>poor response to chemotherapy</b> as compared with peripheral lymphomas</li> <li>- Primary brain lymphoma is often found as <b>multiple tumor nodules within the brain parenchyma</b>, yet the involvement of sites <b>outside</b> of the CNS is <b>uncommon</b></li> <li>- Lymphoma originating outside the CNS <b>rarely</b> spreads to the brain parenchyma</li> </ul>	<ul style="list-style-type: none"> <li>- Involves deep gray structures, as well as the white matter and the cortex</li> <li>- Periventricular spread is <b>common</b></li> <li>- <b>Well defined</b> as compared with glial neoplasms.</li> </ul>	<ul style="list-style-type: none"> <li>- Nearly always <b>aggressive</b> large B-cell lymphomas</li> <li>- Malignant lymphoid cells accumulate around blood vessels and <b>infiltrate</b> the surrounding brain parenchyma.</li> <li>- <b>Positive for B cell markers such as CD20</b></li> </ul>

### 2. Germ Cell Tumors

GENERAL FEATURES	
	<ul style="list-style-type: none"> <li>- Occurs along the <b>midline</b> (<b>most commonly</b> in the <b>pineal and the suprasellar regions</b>)</li> <li>- They are a tumor of the <b>young</b></li> <li>- In the <b>pineal region</b> show a <b>strong male predominance</b></li> <li>- The <b>most common primary CNS germ cell tumor is germinoma</b> (resembles testicular seminoma)</li> <li>- <b>Secondary CNS involvement</b> by metastatic gonadal germ cell tumors also <b>occurs</b></li> </ul>

## 5) Meningiomas (WHO grade I-III)

Meningiomas			
GENERAL FEATURES	MORPHOLOGY		
	GRADE I	GRADE II	GRADE III
<ul style="list-style-type: none"> <li>- <b>Benign</b> tumors arise from arachnoid meningeothelial cells.</li> <li>- Usually in <b>adults</b> and are <b>often attached to the dura</b></li> <li>- <b>Most in adult females</b>, Tumor cells contain PROGESTERON receptors</li> <li>- May be found along any of the external surfaces of the brain</li> <li>- Presents with <b>vague Sx</b> or <b>focal findings</b> due to compression of the adjacent brain</li> <li>- <b>Most</b> are <b>easily separable</b> from the underlying brain, but <b>some are infiltrative</b></li> <li>- The overall <b>prognosis</b> is determined by the <b>lesion size and location</b>, <b>surgical accessibility</b>, and <b>histologic grade</b></li> <li>- Multiple meningiomas are <b>associated with</b> neurofibromatosis type 2 (<b>NF2</b>)</li> <li>- About half of meningiomas not associated with NF2 have mutations in the NF2 tumor suppressor gene (in all grades)</li> </ul>	<ul style="list-style-type: none"> <li>- Grows as dura-based masses that may compress the brain, <b>but No brain invasion</b></li> <li>- <b>Extension</b> into the overlying <b>bone</b> <b>may be present</b></li> </ul> <p><b>Histologic patterns:</b></p> <ul style="list-style-type: none"> <li>- <b>Meningothelial</b> (whorled clusters of cells without visible cell membranes)</li> <li>- <b>Fibroblastic</b> (elongated cells and abundant collagen deposition)</li> <li>- <b>Transitional</b> (features of the meningothelial and fibroblastic types)</li> <li>- <b>Psammomatous</b> (numerous psammoma bodies)</li> <li>- <b>Secretory</b> (glandlike spaces containing PAS-positive eosinophilic material)</li> </ul>	<ul style="list-style-type: none"> <li>- These tumors demonstrate more aggressive local growth and a <b>higher rate of recurrence</b></li> <li>- The presence of either an <b>increased mitotic rate</b> <b>OR</b> prominent nucleoli, increased cellularity, patternless growth, high nucleus-to-cytoplasm ratio, or necrosis</li> <li>- <b>Histologic patterns</b>—<b>clear cell and chordoid</b></li> <li>- <b>The presence of brain invasion</b></li> </ul>	<ul style="list-style-type: none"> <li>- Highly aggressive tumors that may <b>resemble</b> a high-grade sarcoma or carcinoma <b>morphologically</b></li> <li>- <b>Mitotic rates</b> are typically much <b>higher</b> than in <b>atypical meningiomas</b></li> <li>- <b>Papillary</b> or <b>Rhabdoid</b> morphology</li> </ul>

## 6) Metastatic Tumors

Metastatic Tumors	
GENERAL FEATURES	GROSS
<ul style="list-style-type: none"> <li>- Mostly <b>carcinomas</b></li> <li>- The <b>most common primary sites</b> are the <b>lung, breast, skin (melanoma), kidney, and gastrointestinal tract</b>, which together account for about <b>80% of cases</b></li> </ul>	<ul style="list-style-type: none"> <li>- Form <b>sharply demarcated masses</b> (usually <b>multiple</b>), often at the grey-white matter junction</li> <li>- The <b>boundary</b> between tumor and brain parenchyma <b>is sharp at the microscopic level as well</b>, with surrounding reactive <b>gliosis</b></li> </ul>

## 7) Familial Tumor Syndromes

### Familial Tumor Syndromes

#### 1. Tuberous Sclerosis

- An **autosomal dominant** syndrome

-Results from **disruption of:**

**TSC1** tumor suppressor genes, which **encodes hamartin**,

**Or**

**TSC2**, which **encodes tuberin**

(Proteins regulate protein synthesis & cell proliferation)

- Characterized by the development of **hamartomas and benign neoplasms** involving the brain and other tissues

#### 2. Von Hippel-Lindau Disease

- An **autosomal dominant** disorder

- The **affected gene**, the **tumor suppressor VHL**, **encodes** a protein that degrades the transcription factor hypoxia-inducible factor **(HIF)**

- Tumors arising in patients with von Hippel–Lindau disease generally have lost all VHL protein function

- As a result, the **tumors express high levels of HIF**, which **drives the expression of VEGF, various growth factors, and sometimes erythropoietin**

- Individuals develop **hemangioblastomas** within the cerebellar hemispheres, retina, and, less commonly, the brain stem, spinal cord, and nerve roots

- Patients also **may have cysts** involving the pancreas, liver, and kidneys and have an **increased propensity to develop renal cell carcinoma**

#### Cortical hamartomas

##### MORPHOLOGY

-**Firmer** than normal cortex and have been likened in **appearance to potatoes**

- Composed of **haphazardly arranged** large neurons that **lack** the **normal cortical laminar architecture**

- May exhibit a **mixture of glial** and **neuronal** features

- Similar abnormal cells are present in **subependymal nodules**

#### Hemangioblastoma

##### MORPHOLOGY

- A **highly vascular neoplasm** that occurs as a **mural nodule** associated with a large, **fluid-filled cyst**

- Occurs most commonly in the **cerebellum**

➤**Microscopically: -**

- Consists of numerous capillary-sized or larger thin-walled vessels separated by intervening stromal cells with a **vacuolated, lightly PAS-positive, lipid-rich cytoplasm**

-The stromal cells express **inhibin**.

#### CNS hamartomas:

-Consists of cortical tubers and subependymal hamartomas, including a larger tumefactive form known as **subependymal giant cell astrocytoma**.

- Because of their **proximity to the foramen of Monro**, they often present **acutely with obstructive hydrocephalus**.

- **Seizures are associated with cortical tubers**.
