Pathology Lecture 6

CNS Infections

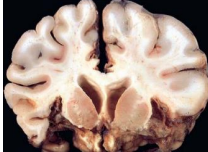

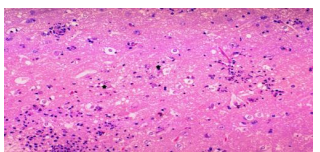

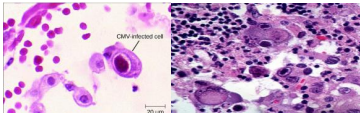

**PARENCHYMAL INFECTIONS**

- Infectious pathogens (viruses, parasites, bacterial)
- In general, viral infections are diffuse, and bacterial infections (when not associated with meningitis) are localized
- While other organisms may produce mixed patterns - Immunosuppressed hosts show more widespread involvement with any agent

<b>BRAIN ABSCESS</b>	<b>GENERAL FEATURES</b>	<ul style="list-style-type: none"> <li>- Brain abscesses are most often caused by <b>bacterial infections</b></li> <li>- <b>Direct implantation</b> of organisms, or <b>local extension</b> from adjacent foci (paranasal sinusitis, mastoiditis)</li> <li>- <b>Hematogenous route</b> from heart, lungs or after tooth extraction</li> <li>- CSF have little role in the diagnosis. Organisms are more reliably <b>cultured</b> by draining the abscess directly</li> <li>- <b>CLINICAL PRESENTATION</b>: Progressive focal deficit, and signs of increase ICP</li> </ul>	
	<b>GROSSLY</b>	<ul style="list-style-type: none"> <li>- Discrete lesion with <b>central liquefactive necrosis</b></li> <li>- <b>Localized</b> liquefactive necrosis surrounded by <b>granulation tissue</b> &amp; <b>severe edema</b> leading to <b>increase ICP</b></li> </ul> <div style="display: flex; justify-content: space-around;">   </div>	<b>COMPLICATIONS</b>

<b>VIRAL ENCEPHALITIS</b>	<b>General Features</b>	<p><b>Viral encephalitis</b> is a parenchymal infection of the brain that is almost <b>associated with meningeal inflammation</b> (meningoencephalitis)</p> <p><b>FEATURES</b> common to most viral infections:</p> <ul style="list-style-type: none"> <li>- Perivascular and parenchymal mononuclear cell infiltrates</li> <li>- Microglial nodules &amp; neuronophagia</li> <li>- Characteristic inclusion bodies</li> </ul> <p><b>**Prominent perivascular inflammatory cell infiltrates</b> indicative of viral encephalitis</p> <div style="text-align: center;">  </div>		
	<b>Examples</b>	<ul style="list-style-type: none"> <li>- ARBO VIRUSES (West Nile, Equines,... etc)</li> <li>- Herpes Zoster</li> <li>- RABIES</li> <li>- Measles (Subacute Sclerosing Panencephalitis)</li> <li>- CMV</li> <li>- HIV</li> <li>- HSV1 &amp; HSV2</li> <li>- POLIO</li> <li>- JC (Progressive Multifocal Leukoencephalopathy)</li> </ul>		

# 1. Viral Encephalitis

<p><b>1) Herpes Simplex Virus Type 1&amp;2</b></p>	<p><b>HSV1</b> &gt;90% of cases</p>	<ul style="list-style-type: none"> <li>- Children or young adults</li> <li>- Hemorrhagic necrotizing inflammation in <b>temporal lobe &amp; orbital gyri of frontal lobe</b></li> <li>- <b>SYMPTOMS</b>: alteration in mood, memory, and behavior</li> <li>- <b>MORPHOLOGY</b>: all common features of viral encephalitis seen + (Cowdry type A) <b>intranuclear</b> viral inclusions in <b>neurons &amp; glial cells</b></li> </ul>	<p><b>HSV2</b> less common</p>	<ul style="list-style-type: none"> <li>- In <b>adults</b> may cause meningitis</li> <li>- <b>Disseminated severe encephalitis</b> occurs in many neonates born by vaginal delivery to women with <b>active primary HSV genital infections</b></li> </ul>			
	<p>Gross &amp; Morphological Features</p>	<p>Herpes encephalitis showing extensive destruction of <b>inferior frontal and anterior temporal lobes.</b></p>		<p>Herpes encephalitis Basal view of the <b>hemorrhagic lesion</b> in the right medial temporal lobe.</p>		<p>Herpes encephalitis Numerous <b>intranuclear Cowdry A inclusions</b></p>	
<p><b>2) Varicella-Zoster Virus (Herpes-Zoster)</b></p>	<p>General Features</p>	<ul style="list-style-type: none"> <li>- Causing <b>Chicken pox</b> during <b>primary infection</b> in children.</li> <li>- <b>Latent infection</b> in <b>dorsal root ganglia</b></li> <li>- <b>Reactivation in adults (Shingles)</b>: <b>painful vesicular skin eruption</b> along a dorsal nerve in <b>one or a few dermatomes, Self-limited</b></li> <li>- In <b>immunosuppressed</b> patients, may show <b>acute encephalitis</b></li> </ul>					
<p><b>3) Cytomegalovirus CMV</b></p>	<p>General Features</p>	<ul style="list-style-type: none"> <li>- <b>Immunosuppressed especially AIDS</b>: <b>subacute encephalitis</b> in <b>any region &amp; any cell</b> but <b>mainly Paraventricular subependymal region of the brain</b> → <b>Severe hemorrhagic necrotizing ventriculoencephalitis</b></li> <li>- <b>Fetus</b>: (CMV IS PASSED TO FETUS THROUGH PLACENTA) <b>intrauterine infection</b> causes <b>periventricular necrosis</b> and <b>brain destruction</b>, followed later by <b>microcephaly</b> with <b>periventricular calcification</b></li> </ul>	  				
<p><b>4) Rabies Virus</b></p>	<p>General Features &amp; Symptoms</p>	<ul style="list-style-type: none"> <li>- <b>Severe encephalitis (fatal)</b></li> <li>- <b>Transmitted</b> to humans by <b>bite of a rabid animal</b> such as dog</li> <li>- <b>Ascends</b> along peripheral nerve from bite site</li> <li>- <b>SYMPTOMS</b>: <b>headache, fever, extraordinary CNS excitability, periods of mania and stupor</b></li> <li>- <b>Neuronal degeneration</b> and <b>inflammatory reaction</b>, most severe in brain stem</li> </ul>	<p><b>NEGRI BODIES</b>: <b>cytoplasmic, eosinophilic inclusions</b> in <b>pyramidal neurons of the hippocampus &amp; Purkinje cells of cerebellum</b>, in sites usually devoid of inflammation</p> 				

5) Poliovirus	General Features	<ul style="list-style-type: none"> <li>- <b>Enterovirus</b> causing mild gastroenteritis</li> <li>- Involvement of CNS in the <b>non-immunized</b></li> <li><b>ACUTE:</b> mononuclear cell <b>perivascular cuffs</b> and <b>neuronophagia</b> of the anterior horn motor neurons of the spinal cord</li> <li><b>CHRONIC:</b> loss of neurons and <b>atrophy</b> of the anterior (motor) spinal roots, and <b>neurogenic atrophy of muscle</b>.</li> </ul>
	Clinical Presentation	<ul style="list-style-type: none"> <li>- <b>Flaccid paralysis</b> with muscle wasting</li> <li>- <b>Death</b> can occur from <b>paralysis of the respiratory muscles</b> in acute phase</li> </ul>

6) HIV	General Features	<ul style="list-style-type: none"> <li>- <b>Early:</b> aseptic viral meningitis in <b>10%</b></li> <li>- <b>Chronic:</b> HIV Encephalitis &gt;&gt; <b>chronic inflammatory reaction</b> with widely distributed <b>microglial nodules</b> with <b>multinucleated giant cells</b></li> <li>- HIV can <b>directly</b> cause meningoencephalitis, or <b>indirectly</b> affect the brain by increasing the risk for opportunistic infections (toxoplasmosis, CMV) or CNS lymphoma</li> <li>-HIV- associated dementia</li> </ul>
--------	------------------	---

7) JC VIRUS → PML	General Features	<ul style="list-style-type: none"> <li>- Caused by <b>JC polyomavirus exposure</b> during childhood</li> <li>- <b>Infect oligodendrocytes</b></li> <li>- <b>Reactivation</b> mainly in <b>AIDS patients &amp; other immunosuppressed patients</b></li> <li>- <b>RESULT:</b> Progressive <b>demyelination of white matter</b></li> </ul>	
	Morphology	Grossly	- Patches of <b>irregular, ill-defined destruction</b> of white matter <b>from mm</b> to extensive involvement of <b>the entire lobe</b>
		Microscopy	<ul style="list-style-type: none"> <li>- Patches of <b>demyelination</b>, with scattered <b>lipid laden macrophages</b> at the center, and <b>reduced number of axons</b></li> <li><b>Enlarged oligodendrocyte nuclei</b> with viral inclusions</li> <li>At the edges of the lesion are greatly enlarged oligodendrocyte nuclei whose chromatin is replaced by <b>glassy appearing amphophilic JC viral inclusions</b></li> </ul>

## 2. Fungal Encephalitis & Other Meningoencephalitides

### FUNGAL ENCEPHALITIS

- Candida, Cryptococcus, Aspergillus, & Mucormycosis
- Mainly in immunocompromised patients
- Hematogenous or direct invasion
- Parenchymal granulomas or abscesses, often associated with meningitis
- AIDS patients are prone to cryptococcal meningoencephalitis

#### Aspergillus fumigatus

Tends to cause a distinctive pattern of widespread septic hemorrhagic infarctions because of its marked predilection for blood vessel wall invasion with subsequent thrombosis

GMS Stain

#### Toxoplasmosis

##### Cerebral Toxoplasmosis:

- Immuno-compromised patients, especially (AIDS)
- Small, usually multiple abscesses & necrotic foci
- Both free tachyzoites and encysted bradyzoites may be found at the periphery of the necrotic foci
- IN NEWBORNS (CONGENITAL TOXOPLASMOSIS) who are infected in utero: triad of chorioretinitis, hydrocephalus, and intracranial calcifications

##### The Classic Triad

All 3 findings together: rare, but highly suggestive

#### Prion Diseases

- A group of infectious diseases in which the causative agent is an abnormal form of a cellular protein
- The causative protein > prion protein (PrP), may undergo a conformational change from its normal shape (PrPc) to an abnormal conformation called PrPsc

##### Include a variety of conditions:

- Sporadic and familial Creutzfeldt- Jacob Disease (CJD)
- Scrapie in sheep
- Bovine spongiform encephalopathy in cattle ("mad cow disease")

##### Epidemiology & General Features

- 1 per million incidence, 7th decade
- Rapidly progressive dementia
- FATAL, no treatment known, like ALL prion diseases
- Sporadic cases 85%
- Onset of subtle changes in memory and behavior to death is only 7 months
- Familial cases (15%), younger

#### Creutzfeldt-Jacob Disease (CJD)

##### Cause & Consequences

- CJD is caused by abnormal proteins called prions that are not killed by standard methods for sterilizing surgical equipment
- As prions build up in cells, the brain slowly shrinks, and the tissue fills with holes until it resembles a sponge
- Those affected lose the ability to think and to move properly and suffer from memory loss
- It is always fatal, usually within one year of onset of illness

##### Microscopy

- Multifocal spongiform transformation (Intracellular vacuoles in neurons and glia) of cerebral cortex & deep gray matter.
- No inflammatory infiltrate is present.
- ADVANCED CASES: neuronal loss and gliosis
